

CLINICAL SUMMARY REPORT

Fictional Condition – Demonstration Document Only

Healthcare Organisation: Example Children's Health Trust

Department: Paediatrics

Date: 23 December 2025

IMPORTANT NOTICE

This document describes a fictional medical condition created solely for demonstration, training, and software testing purposes. It must not be used for real clinical decision-making.

Patient Information

Patient Age	5 years
Care Setting	Primary / Community Care
Record Type	Fictional

Condition Name

Paediatric Imaginative Hyperactivity Syndrome (PIHS) (Fictitious)

Clinical Description

Paediatric Imaginative Hyperactivity Syndrome (PIHS) is a fictional, non-pathological paediatric presentation characterised by heightened imaginative engagement and episodic expressive behaviour in early childhood.

Presenting Features

- Heightened imaginative play
- Spontaneous laughter or vocalisation
- Increased physical activity
- Creative reinterpretation of objects
- Resistance to routine transitions

Management Plan

No medical intervention is indicated. Supportive measures include structured routines, creative play, adequate sleep, balanced nutrition, and parental reassurance.

Prognosis

Excellent. The presentation resolves naturally with age.
